

PRACTICAL COURSE WORKBOOK

Python for AI & Data Science

Turn untidy data into a defensible finding

LEVEL	Beginner
GUIDED TIME	5 hours across 12 lessons
PROJECT	a cleaned dataset, analysis and decision-ready chart
SKILLS	Python, NumPy, Pandas, Matplotlib, Critical evaluation, Documentation
EDITORIAL STATUS	Structured draft v0.9

WHAT YOU WILL BE ABLE TO DO

- Use Python appropriately in a realistic, bounded task.
- Use NumPy appropriately in a realistic, bounded task.
- Use Pandas appropriately in a realistic, bounded task.
- Use Matplotlib appropriately in a realistic, bounded task.

WHO THIS IS FOR

Learners using data and code to answer practical questions.

BEFORE YOU BEGIN

- Basic numeracy and file-management skills

This open workbook is a structured draft undergoing course-specific editorial review. It does not provide certification.

COURSE MAP

From foundation to finished work

Python for AI & Data Science is a structured, practical course covering Python, NumPy, Pandas, Matplotlib. It emphasizes explainable methods, checked work and a final outcome that can be reviewed.

MODULE	LESSONS AND FOCUS
01 Python: Data foundations	1. Problem framing with Python 2. Data types with NumPy 3. Tool setup with Pandas
02 NumPy: Analysis	1. Cleaning with Matplotlib 2. Exploration with Python 3. Modelling with NumPy
03 Pandas: Evaluation	1. Validation with Pandas 2. Uncertainty with Matplotlib 3. Communication with Python
04 Matplotlib: Applied project	1. Workflow with NumPy 2. Review with Pandas 3. Reproducibility with Matplotlib

HOW TO STUDY EACH LESSON

- 1 Read the objective and identify the decision it supports.
- 2 Reproduce the worked example with the stated input.
- 3 Test one normal case and one boundary or failure case.
- 4 Complete the knowledge check without guessing.
- 5 Save a short evidence note: result, limitation and next action.

CAPSTONE PROJECT

Produce a reviewable Python for AI & Data Science project using Python, NumPy, Pandas.

DELIVERABLE	A working Python for AI & Data Science artefact plus an evidence-based self-review.
TOOLS	A suitable Python environment, A plain-text decision log, Test data or realistic sample material

Production plan

- 1 Define the intended user, outcome and constraints.
- 2 Create the smallest complete result using Python.
- 3 Test one normal case, one boundary case and one failure response.
- 4 Revise the work from the evidence and preserve before-and-after results.
- 5 Prepare a concise handover containing method, limitations and next step.

Definition of done

- The output matches the stated outcome.
- Inputs and decisions are reproducible.
- Boundary and failure evidence is included.
- Limitations and responsibility considerations are explicit.

Evidence log

INPUT	Original brief, data, requirements or test material.
DECISIONS	Chosen method and one reasonable alternative.
TESTS	Normal, boundary and failure results.
LIMITATION	What the result does not establish.
REVISION	One evidence-led improvement.

REVIEW AND SOURCES

Make the work credible and repeatable

Final self-review

- Can another learner repeat the method?
- Did I test a difficult case?
- Did I avoid unsupported claims?
- Is the next action proportionate to the remaining risk?
